

Keploy DevRel Candidate Assignment

Welcome! We're excited to see your skills in action. This assignment is designed to gauge your ability to learn a new concept, build a simple web project, and create developer-focused content, all key responsibilities for a DevRel role at Keploy.

This task will challenge you to apply your skills while exploring new technologies (Next.js and MDX) that are crucial for modern documentation.

Objective

To build a single-page, static documentation website using Next.js and MDX. The content of this page will be a new, beginner-friendly tutorial based on your experience running one of Keploy's Go quickstarts.

The Core Task

Your mission is to:

1. **Learn & Run:** Successfully run a Keploy quickstart for a Go application.
2. **Document:** Write a new tutorial explaining how you did it, targeting a developer who has never used Keploy.
3. **Build & Publish:** Present this tutorial as a single-page website built with Next.js and MDX, and deploy it live on the web.

Key Requirements

- **Framework:** You **must** use **Next.js** to build the site.
- **Content:** The page **must** be built using **MDX** (`.mdx`). This is essential as it will allow you to mix React components directly with your Markdown content.
- **UI Library:** You are **free to use any UI library** you like (e.g., Tailwind CSS, Shadcn/ui, Chakra UI, Material-UI, etc.) to make the page look professional and clean.
- **Content Style:** The page should be a "documentation-like" tutorial. It must include:
 - Clear, step-by-step instructions.
 - **Code snippets** (use MDX's syntax highlighting).
 - Any other interactive UI elements you think would improve the reader's experience (e.g., callout boxes, "info" alerts, diagrams, etc.).

Step-by-Step Guide

Here is the process we recommend you follow:

1. **Choose Your Quickstart:**
 - Go to the [Keploy Quickstart Documentation](#).
 - Select the **"Go"** language filter.
 - Pick one of the available Go quickstarts (e.g., "Gin + Mongo", "Echo + SQL", etc.).
2. **Run it Locally:**
 - Follow the *existing* documentation to get the sample application and Keploy running on your local machine.
 - Record some test cases and run them (`keploy record` and `keploy test`).
 - **Take notes!** Pay attention to any step that was confusing, or any "a-ha!" moment you had.
3. **Set up Your Next.js Project:**
 - Create a new Next.js app.
 - Configure it to use MDX. (Here's a good starting point: [Next.js MDX Documentation](#)).
4. **Write Your MDX Tutorial:**
 - Create your `page.mdx` (or equivalent) file.
 - Write your new tutorial based on the notes you took. **Do not simply copy-paste the existing documentation.** We want *your* voice and *your* explanation in crisp and to the point format.
 - Explain the "why" behind the steps. What is Keploy doing? Why is this useful for a Go developer?
 - Use Markdown for text and MDX's capabilities to embed code blocks and any custom React components you choose to build (e.g., a `<Callout type="info">...</Callout>` component).
5. **Deploy:**
 - Push your project's source code to a new, public GitHub repository.
 - Deploy your Next.js site to [Vercel](#) (it's free and integrates perfectly with Next.js).

Deliverables

Please reply back with the following two links:

1. **The link to your public GitHub repository** containing the source code.
2. **The live Vercel deployment link** of your finished documentation page.

Evaluation Criteria

We will be looking at:

- **Content Quality:** How clear, accurate, and helpful is your tutorial? Does it successfully guide a new user through the process?
- **Technical Implementation:** Did you successfully build a static page using Next.js and MDX?
- **UI/UX:** Is the page easy to read and visually appealing? (It doesn't need to be a design masterpiece, just clean and professional).
- **Attention to Detail:** Does the code work? Are there typos? Is the GitHub repo clean?

Bonus Points

Going the extra mile on the user interface will be noticed. Bonus points will be awarded for:

- A high-quality, polished UI.
- Thoughtful UI integrations, such as a **dark/light mode toggle**.
- Excellent use of your chosen UI library's components throughout the page to enhance readability and interaction.

Good luck! We're excited to see what you build. If you have any clarifying questions about the assignment, please don't hesitate to ask.
